

Project Proposal Presentation

Keyword: proposal

We do not require results or working implementations! However, nice, clear results and implementations will demonstrate feasibility of your proposal will increase your chance to get high score!

Logistics

- Please tell the TAs your group member (individually or 2/3 group members) before 11:59pm China Standard Time (CST) on **5 April 2026**
- If we do not receive your group information by the end **5 April 2026**, we will assume that you do not wish to participate, and you will receive **a zero for the project presentation**.
- **For a group presentation, you can choose a presentative to present or you can take turn to present the part that you are in charge of. But group members share the same score based on your presentation content and your presentation performance**
- **Report is not required. Just slides and presentation.**
- Project groups can be between 1 and 3 people
- Each participant will only be allowed to be in one group and present one project pitch
- The expectation of a group with 2 or 3 people will be higher than the single person (tradeoff)

Things to Consider for Project Proposal

- 1) This **doesn't** have to be a new machine intelligence method. It can just be an interesting application that you apply some existing machine intelligence method to. But a new machine intelligence method (including deep learning method) is also welcome.
- 2) What problem are you solving? Are there use cases/applications?
- 3) How have people done it before? Is it a new task? If so, what are similar tasks that people have worked on? In what aspects have they succeeded or failed?
- 4) What is your method of solving this problem? What type of model + architecture would you use? Why?
- 5) What is the data for this task? Do you need to make a dataset or is there one publicly available? What are the characteristics of the data? How would you deal with that?
- 6) **For graduate students, you are not allowed to present other people's published work (i.e., the papers that you are not in the author lists). You should clearly specify your proposed idea/method/result.**

Project Proposal Grading

Project proposals will be evaluated by our course staffs (70%) and your classmates (30%) on the basis of the following three criteria: 1) novelty and impact; 2) technical soundness, feasibility, and organization, including quality of any presented results; 3) clarity and presentation; 4) time limits. Each judge will award a score from 1 (lowest) to 5 (highest) for

each of the criteria; the average score from each judge across these criteria will then be weighted and averaged with that of the other judges to provide the final score.

Here are the guidelines for the criteria:

1. **Novelty and impact:** encompasses the potential impact of the project idea, its novelty with respect to existing approaches. Why does the proposed work matter? What problem(s) does it solve? Why are these problems important?
2. **Technical soundness, feasibility, and organization:** encompasses all technical aspects of the proposal. Do the proposed methodology and architecture make sense? Is the architecture the best suited for the proposed problem? How realistic is it to implement the idea? Was there any implementation of the method? If results and data are presented, we will evaluate the strength of the results/data.
3. **Clarity and presentation:** encompasses the delivery and quality of the presentation itself. Is the talk well organized? Are the slides aesthetically compelling? Is there a clear, well-delivered narrative? Are the problem and proposed method clearly presented?
4. **Time limits:** Stay within the assigned time-frame.

Examples of Project Proposal Ideas

Modelling Pet Adoption Rate

The applications of AI to road traffic analysis and optimization

Machine Learning and Game Theoretic Approaches to Fighting Crime

Optimizing Vehicle Routing for Bike Sharing System

Predicting stock market trends

Show language learners articles or videos at their level

CSP Algorithm with Spatio-Temporal Filtering for Motor Imagery Classification
